METHOD, SYSTEM, AND PROGRAM FOR DETERMINING INFORMATION ON A STORAGE SYSTEM IN A NETWORK ABSTRACT

Provided are a method, system, and program for providing information on a

5 network storage system. Information is received from host systems identifying storage
units the host systems access through at least one identified storage system. The at least
one storage system is probed to determine storage units available through the storage
system and an identifier of the storage system. The information received from the host
systems on storage units the host systems access and the information probed from the at
least one storage system on the storage units available through the storage system are
processed to determine an association of host systems to storage units for the at least one
storage system.
